

STEPS FOLLOWED:

- **Backend setup:**

1. Used SQLAlchemy to create the database models with FastAPI.
2. Added initial data for Phuket, Krabi and Bangkok regions in Seed.py.
3. RESTful API endpoints for CRUD on itineraries.
4. Took the help of AI for creating the table design for the used database.
5. CORS middleware was used to enable frontend communications.
6. Used curl and postman to test the API working.

- **Frontend setup:**

1. Built UI using React with axios for API communication.
2. Designed UI to showcase the data from backend API on React server.

KEY DECISIONS:

- **Tech Stack used:**

1. FastAPI with SQLAlchemy and SQLite for database and API.
2. React for frontend.

- **Database Design:**

1. Used Stars for rating the hotels and price for their per night rate.
2. Day_activities table for many-to-many relationships.
3. Used AI to provide me data for database tables.

ASSUMPTIONS:

1. Only pre-defined itineraries are used.
2. Regions are also fixed.

CHALLENGES & RESOLUTIONS:

1. **Challenge:** How to show data in a clear and precise way.

Fix: Created an interface with React to display some data from API.

2. **Challenge:** How the database should contain the fields and data.

Fix: Used AI for providing me details for data needed for database.

3. **Challenge:** How to complete the code in specific time constraint.

Fix: Took the help of ChatGPT for providing me the boiler code for some files as per my needs and then I debug those code files according to the use case.
